

FLOOR CARE AND MAINTENANCE GUIDE FOR QUARTZ ENHANCED SPC

AFTER INSTALLATION

Floors should be cleaned immediately after installation by sweeping and/or vacuuming and removing dust. A slightly damp mop should also be used to help assure dust is removed. Do not use a wet mop. If floors need further cleaning, use a cleaner recommended for vinyl floors.

REGULAR MAINTENANCE

Residential and Commercial - Sweep and/or vacuum as needed. Daily cleaning is recommended. Make sure the vacuum does not use a beater bar which can damage your floors. Wipe spills and excessive liquids immediately. Use a damp mop as needed and cleaners specifically made for vinyl floors that contain no wax or oil. Do not use any abrasive cleaners, bleach, or wax to maintain your floor.

LONG TERM CARE AND MAINTENANCE

Residential and Commercial - Place rugs or pads near all entrances and try to assure that all sand and other debris is kept off the floors. Use proper floor protection devices such as felt protectors under furniture. Do not drag or slide heavy objects across the floor.

Protect the floor against direct sunlight or any intense source of artificial light. Over time, intense light will discolor exposed surfaces and intense heat may damage the floor. Avoid excessive low or high temperatures. We recommend keeping the flooring above 55°F and below 100°F.

Some rubbers contain chemicals that can react with vinyl. Avoid rubber contact with the floor.
